ABSTRACT

Conducting research in emergency settings is paramount to advance knowledge and experiences on dealing with critically ill patients. However, the involvement of highly vulnerable subjects, who are mostly incapable of consenting to research participation is challenging. This research paper describes the extent of emergency research and its related ethical issues within emergency settings in the Middle East. A literature review covering several databases was conducted. Several studies conducted within the emergency departments in the Middle Eastern region were located. All studies focused on provision of emergency care, while none described aspects of emergency research. Current literature indicates a dearth of research concerning emergency research settings in developing countries mainly in the Middle Eastern region. Up to the authors’ knowledge, this is the first research paper to review the available literature on emergency research in the Middle East. Findings from this review suggests that more efforts focusing on emergency research should be encouraged and stimulated in the region, in order to improve the effectiveness and safety of healthcare provision to critically ill patients within emergency departments. Adding to that, our findings stimulate the needs for regulatory bodies and regulations that help overcome the main ethical issues surrounding the principle of obtaining informed consents in emergency settings.

Keywords: Emergency; Research; Middle East; Ethics.

INTRODUCTION

Provision of healthcare in emergency settings should be based on best research evidence to ensure safe, and effective procedures/treatments[1]. Therefore, conducting research in emergency settings is important to advance knowledge and experiences on dealing and/or treating critically ill patients[2]. Corresponding to that, a report in 2016 showed that the National Institutes of Health support more studies covering clinical emergency care research[3]. Emergency settings involve highly vulnerable subjects, who are mostly incapable to provide consent to medical procedures and / or research participation[4]. Such emergent problems mandate immediate actions, where healthcare providers are responsible for assuring the provision of effective and safe interventions[5]. Given the complexity of situations, it would be highly demanding to obtain informed consents (in a timely manner) from unstable patients or their legal representatives in order to provide them with required interventions such as Cardio-Pulmonary-Resuscitation (CPR)[6]. As a result, such situations represent a substantial ethical challenge to healthcare providers and researchers who basically deal with emergency cases[7].

Worldwide, since the mid of 70’s and according to the Belmont report, researchers and healthcare practitioners must respect the utmost importance of subject’s autonomy “respect for the patient's capacity of self-determination, and exercise of personal choice,” [8] represented by the
principle of informed consent. However, the problematic situation with emergency research originates from the fact that it is not always possible to obtain informed consents from patients who are unconscious, unable to communicate with healthcare providers or researchers, or undergoing tremendous physical and/or psychological stress. Because outcomes in emergency settings depend mainly on the earliest provided intervention, any delay (even short) to obtain consent (including proxy consent) may cause mortality or loss of survival chances. In accordance to that the Federal Drug Administration established a policy in 1996 “Exception from Informed Consent (EFIC)” as an attempt to balance between human right of “Autonomy” and the progress of medical practices and research in emergency settings. In addition to that the FDA still mandates several protective measures to emphasize on patients autonomy. First of all, FDA articulates conditions for applying EFIC policy. Such conditions include unexpected case scenarios with life threatening conditions, such as dealing with debilitated or incapacitated patients, lack of proven or satisfactory treatment options, availability of interventions that might achieve direct benefit to the health of patients, feasibility of offering treatments on timely manner (prior to obtaining proxy consent from legally authorized representatives), and community consultation. Such requirements, however, remains unclear and poorly defined to both emergency healthcare practitioners and researchers. Studies have revealed high levels of frustration among emergency researchers within some settings, where physicians have a full power to prescribe, even without an ethical approval, pharmaceuticals that have not been scientifically approved effective and safe for certain medical conditions.

Besides researchers’ and healthcare providers’ opinion about waiving informed consent in emergency settings, many studies have shown that public’s opinion and acceptance to this principle is vague. There is no clear answer to the question of as to whether available regulations that allow for waiving informed consent in emergency settings could protect public health and human rights. Worldwide, it is highly recommended to educate populations about medical research within different settings and the importance of public involvement in research. Shedding light on factors that can influence and/or hinder public trust in medical research especially in research without consent is highly needed.

Even though emergency departments in developing countries serve very large populations with increased levels of mortality and critical illnesses, little or no regulations and rules that demarcate emergency practices and research principles are available. As an example, the Jordanian Clinical Research Law of 2001, covers none regarding emergency research and its ethical related issues. This research paper aimed to review research examining emergency research and challenging ethical issues in emergency situations within developing countries, focusing on Middle East. Application of different ethical rules and regulations permitting research of this kind within this region was the main focus of the current search.

**Research Methods**

Several databases were searched (September 2020 - February 2021): PubMed, Web of Science, Medline, PsychInfo, Web of Knowledge, and CINAHL. The search terms are listed in Table 1. Research papers were located and individually reviewed by both researchers. Suitability of research papers to be included was based on detailed discussions and agreement between researchers. Final agreement was to locate all peer reviewed papers covering any topic related to emergency medicine and/or research within the Middle Eastern region. References lists of located papers were searched to identify relevant papers. Only articles pertaining to issues of conducting emergency research in developing countries mainly within the Middle Eastern region were included. Research papers published in languages other than English were excluded.
Results

Considering the wealth of literature on emergency research and its related ethical issues in many developed countries, there was relatively little or no information about emergency research in the Middle East. Using the terms relating to emergency research and ethical issues (Table 1) 639 articles were elicited from all databases collectively. Combining these terms resulted in a total of 41 papers; after reviewing the titles and abstracts two were deemed to be totally unrelated for this review. Among the located studies eight were from Jordan [22-29], nine from Turkey [30-38], one from Yemen [39], five from Egypt [40-44], three from Iran [45-47], five from Lebanon [48-52], six from Saudi Arabia [53-58] and two from United Arab Emirates (UAE) [59, 60]. All located studies are summarized below in Table 2.

Since the mid of 90’s, research concerning emergency medicine within emergency settings in the Middle East was conducted [34, 38]. Located studies focused on the development of emergency care specialty and services and the status of emergency medical care within different institutions [22, 36, 48]. In addition, several publications have highlighted the characteristics of emergency care visitors, appropriateness of emergency department visits and the level of satisfaction with provided care [23, 28, 30, 31, 33, 36, 37]. However, none was found on emergency research and ethical issues associated with it. Unfortunately, studies were not designed to investigate emergency research in any depth, but to describe technical aspects of available emergency medicine and offered practices and/or services. It appears as to confront a situation with major ignorance of scientific emergency research and its associated ethical issues within emergency settings in the Middle East.

Despite the fact that, ample research has been conducted within our region to discuss aspects of ethical considerations in different medical departments [61-64]. None was found covering such considerations within the field of emergency research. Such results reflect the dearth of evidence on conducting emergency research within the Middle Eastern

**Discussion**

Emergency research is essentially important and necessary to enhance and improve public health related outcomes. In the Middle East, emergency settings are crowded by several endemics and outbreaks\[65\]. Therefore, it is important to highlight ethical issues related to emergency research in such setting.

Based on the findings of our literature review, data related to emergency medicine research and ethical governors in MENA region is scarce, and research field in emergency settings is a shady, mysterious area. A potential explanation to this finding is lack of enforced regulations related to emergency research, and disciplinary rules as reported in the review of national research ethics guidelines in Arabic Middle Eastern countries conducted by Alahmad and colleagues\[39\]. There was a lack of regulations related to research ethics in vulnerable persons except in Egypt and Qatar where this area was covered in local regulations of both countries. In general, local research highlights the needs for more clinical-research and bioethics focused training, which might be initiated by the development and enhancement of educational approaches for healthcare professional students\[66\]. Additionally, the problem of medication shortage\[67\] and low doctor to patient ratio at emergency departments compared to the acceptable ratio as promulgated by WHO, and overcrowded emergency departments in developing countries\[39\] rendering such setting as less favorable environment for research despite its highly dynamic nature and the vast potential for research conduction.

Furthermore, lack of social awareness, false beliefs related to the concept of research, limited research funding, as well as misunderstanding of research-related terms such as informed consent and legal guardian could
Emergency Research Status...

Further restrict research in developing countries in general, and in incapacitated emergency departments’ patients in particular[39].

Another confounder related to emergency research is the potential conflict related to legal surrogate in light of the absence of the term (durable power of attorney) in MENA region. This aspect is partially governed by local cultural issues and lack of advance care planning in low-income MENA countries[39]. As dictated by cultural beliefs, the role of surrogate is assigned by default to the spouse, older son of the family, or to the older brother based on the depth of familial relationship and inferences.

The strength of the present review lies in covering an important overlooked field that has not been covered by other research conducted in the MENA region. Furthermore, extensive literature review and rigorous search of pertinent studies was followed to prepare this review. As aforementioned, different engines were searched using different search terms. This adds to the reliability of our results. Likewise, it is important to report the possible limitations. Firstly, the limited number of published papers in the scope of emergency research in the MENA region could hinder the accountability of the review. Besides, exclusion of non-English papers is another potential limitation.

The present review is expected to impact the current practices related to emergency research. Reported deficiencies in the area of emergency research should alarm the regulatory authorities to set some rules to better outline research conducted in emergency settings. Additionally, educational campaigns targeting general population should be reinforced to raise awareness level related to responsible conduct of research, and to stress the importance of research in saving lives of patients and their relatives. Future research assessing population and emergency care providers’ perception towards research and related terms, including informed consent is recommended in MENA region to better spot barriers compromising research as perceived by emergency healthcare providers and general population.

Conclusion

The present review highlighted the lack of contemporary data to fully appraise emergency research in the Middle East. Any conducted research in this field is based upon tenuous evidence along vague rules, and this underlines the importance of enforced regulations to protect the welfare of general population and feature scientific emergency services and practices. Noteworthy, Middle Eastern region is geographically close to European countries, which have well-established rules and regulations related to research within emergency settings. As guided by political instability, the Middle East has flooded a significant percentage of refugees to neighboring developed countries, including Europe. The present review highlight the imminent needs to prepare and enact firm rules and regulations better regulate all aspects of medical experiments on human subjects, including emergency research in the Middle East. As a future direction, alignment of consolidated rules and regulations that govern emergency research in the Middle East should improve implemented services and practices within emergency settings in different countries.

ملخص

يعد إجراء البحوث العلمية في حالات الطوارئ أمرًا بالغ الأهمية لتعزيز المعرفة والخبرات حول التعامل مع المرضى ذوي الحالات الحرجة والطوارئة. ومع ذلك، فإن إشراك هؤلاء المرضى، الذين في الغالب غير قادرين على الموافقة والمشاركة في البحث، يمثل تحديًا كبيرًا للباحثين ولمؤسسات الرعاية الصحية. تصف هذه الورقة البحثية الوضع العام للأبحاث في حالات الطوارئ والقضايا الأخلاقية ذات الصلة في منطقة الشرق الأوسط. حيث تم إجراء مراجعة شاملة لعدد من قواعد البيانات وقامت الباحثين بتجميع العديد من الدراسات التي أجريت داخل أقسام الطوارئ في منطقة الشرق الأوسط. ركزت جميع الدراسات المنشورة على أنماط توفير الرعاية الطارئة، بينما لم يصف أي منها جوانب الأبحاث العلمية في حالات الطوارئ. تشير الأبحاث العالمية الحاجة إلى نشر الورقة البحثية بظروف البحث في حالات الطوارئ في البلدان النامية بشكل عام وفي منطقة الشرق الأوسط بشكل خاص. تعتبر هذه الدراسات الأولى من نوعها لدراسة الأبحاث المتوقفة حول طبيعة أبحاث الطوارئ في الشرق الأوسط. تشير النتائج المستخلصة من هذه الدراسة إلى أهمية تشجيع وتحفيز المزيد من الجهود الكبيرة على أبحاث الطوارئ في المنطقة، من أجل تحقيق فعالية وسلامة توفير الرعاية الصحية لمرضى الحالات الحرجة داخل أقسام الطوارئ. إضافة إلى ذلك، تعتبر نتائج هذه الدراسة عن الحاجة لسياسات ومؤسسات إدارية متكاملة لإعداد التعليم على القضايا الأخلاقية الرئيسية المتعلقة بمبدأ الحصول على موافقات مستنيرة للمشاركة في الأبحاث المتعلقة بحالات الطوارئ.

الكلمات الدالة: حالات طوارئ، أبحاث، أخلاقيات، منطقة الشرق الأوسط.
